Download and Clean Testing and Training Data for Project

Download the Testing and Training Data from the web.

There are fields that have the Excel division by year indicator as a value. These need to be converted to NA.

```
train_url <- "https://d396qusza40orc.cloudfront.net/predmachlearn/pml-
training.csv"
download.file(train_url, "pml-training.csv")
raw_train_data <- read.csv("pml-training.csv", na.strings = c("NA", ""))

test_url <- "https://d396qusza40orc.cloudfront.net/predmachlearn/pml-
testing.csv"
download.file(test_url, "pml-testing.csv")
raw_test_data <- read.csv("pml-testing.csv", na.strings = c("NA", ""))</pre>
```

Descriptive Analysis

Before we can begin the anlaysis we need to understand the variables, especially the one one we hope to predict, classe.

```
head(raw_train_data)
                                                               cvtd timestamp
     X user name raw timestamp part 1 raw timestamp part 2

## 5580 3797 3422 3216 3607
```

There are a lot of columnss, and some look like they have a lot of missing (na) values. We will clean these up now.

```
dim(raw_train_data)
## [1] 19622    160

sum_na <- sapply(raw_train_data, function(x) {sum(is.na(x))})
rmv_columns = names(sum_na[sum_na>=10000])
clean_train_data = raw_train_data[, !names(raw_train_data) %in% rmv_columns]
```

We will also remove the frist 7 columns that just contain a lot of metadata that we will not needd.

```
clean_train_data = clean_train_data[,-c(1:7)]
```

Now we can take our training data and partition it into a training set and test for cross validation.

```
library(caret)
## Loading required package: lattice
## Loading required package: ggplot2
inTrain = createDataPartition(y=clean_train_data$classe, p=0.7, list=FALSE)
train_data = clean_train_data[inTrain,]
test_data = clean_train_data[-inTrain,]
```

Modeling Building

Model: Random Forest

First we will build some models predicting the classe variable.

Model 1: rpart (Decision Tree)

Model 2: GBM (Boosting with Trees)

Model 3: Random Forest

```
library(randomForest)
## randomForest 4.6-12
## Type rfNews() to see new features/changes/bug fixes.
## Attaching package: 'randomForest'
## The following object is masked from 'package:ggplot2':
##
##
       margin
library(e1071)
library(rpart)
library(gbm)
## Loading required package: survival
##
## Attaching package: 'survival'
## The following object is masked from 'package:caret':
##
       cluster
##
## Loading required package: splines
## Loading required package: parallel
```

```
## Loaded gbm 2.1.1
set.seed(1234)

mod_rpart <- train(classe~., method = "rpart", data=train_data)
plot(mod_rpart$finalModel, uniform=TRUE, main="Decision Tree")
text(mod_rpart$finalModel, use.n=TRUE, all=TRUE, cex=.8)</pre>
```

Decision Tree

```
mod_gbm <- train(classe~., method = "gbm", data=train_data, verbose=FALSE)
## Loading required package: plyr
mod_rf <- train(classe~., method = "rf", data=train_data)</pre>
```

Then we will use this model to predict on the testing data set and check the results. We will calculate the mean of correct answers. The first mean will be for the rpart model, the second mean will be for the gbm model and the final mean for the Random Forest model.

```
mean_rpart <- mean(predict(mod_rpart, test_data) == test_data$classe) * 100
mean_rpart

## [1] 47.79949

mean_gbm <- mean(predict(mod_gbm, test_data) == test_data$classe) * 100
mean_gbm
## [1] 96.85641</pre>
```

```
mean_rf <- mean(predict(mod_rf, test_data) == test_data$classe) * 100
mean_rf
## [1] 99.62617</pre>
```

Conclusion

This test shows that the Random Forest model is more accurante than the GBM model and RPART model. The random forest model has a testing error (1 - Accuracy of Testing) of 0.3738318, while the GBM model has a testing error of 3.1435854 and the rpart model having an error of 52.2005098.
